# Searching for faint objects near bright objects

Select young & nearby stars to minimize contrast

# The first ADI Survey

No detection (Lafreniere et al 2007)

# The 2nd ADI survey

- Remove “late-type” bias
- Focus on young nearby “massive” stars
- IR excess
- Low in HR diagram

Johnson et al. 2007 RV of evolved A-stars

THE 2ND ADI SURVEY

# HR 8799 Characteristics

• A5V star

• V~6

• 39 pc (130 ly)

• Pegasus

• Lambda Boo, Gamma Dor and Vega-like star

## HR 8799

RA	23h 07 28.7
DEC	+21 08 03.3
Spectral type	A5V
Visual mag.	6.0
Distance	39 pc (130 ly)
Mass	1.5 $M_{\text{Sun}}$
Luminosity	5 $L_{\text{Sun}}$
Temperature	7400K (1.2 $T_{\text{Sun}}$ )
Age	60 Myr [30–160]

cellarium

Keck II obs.

# Discovery made with Gemini North with Altair/Niri

Gemini N, Altair/NIRI & 10s K-band

ADI processing

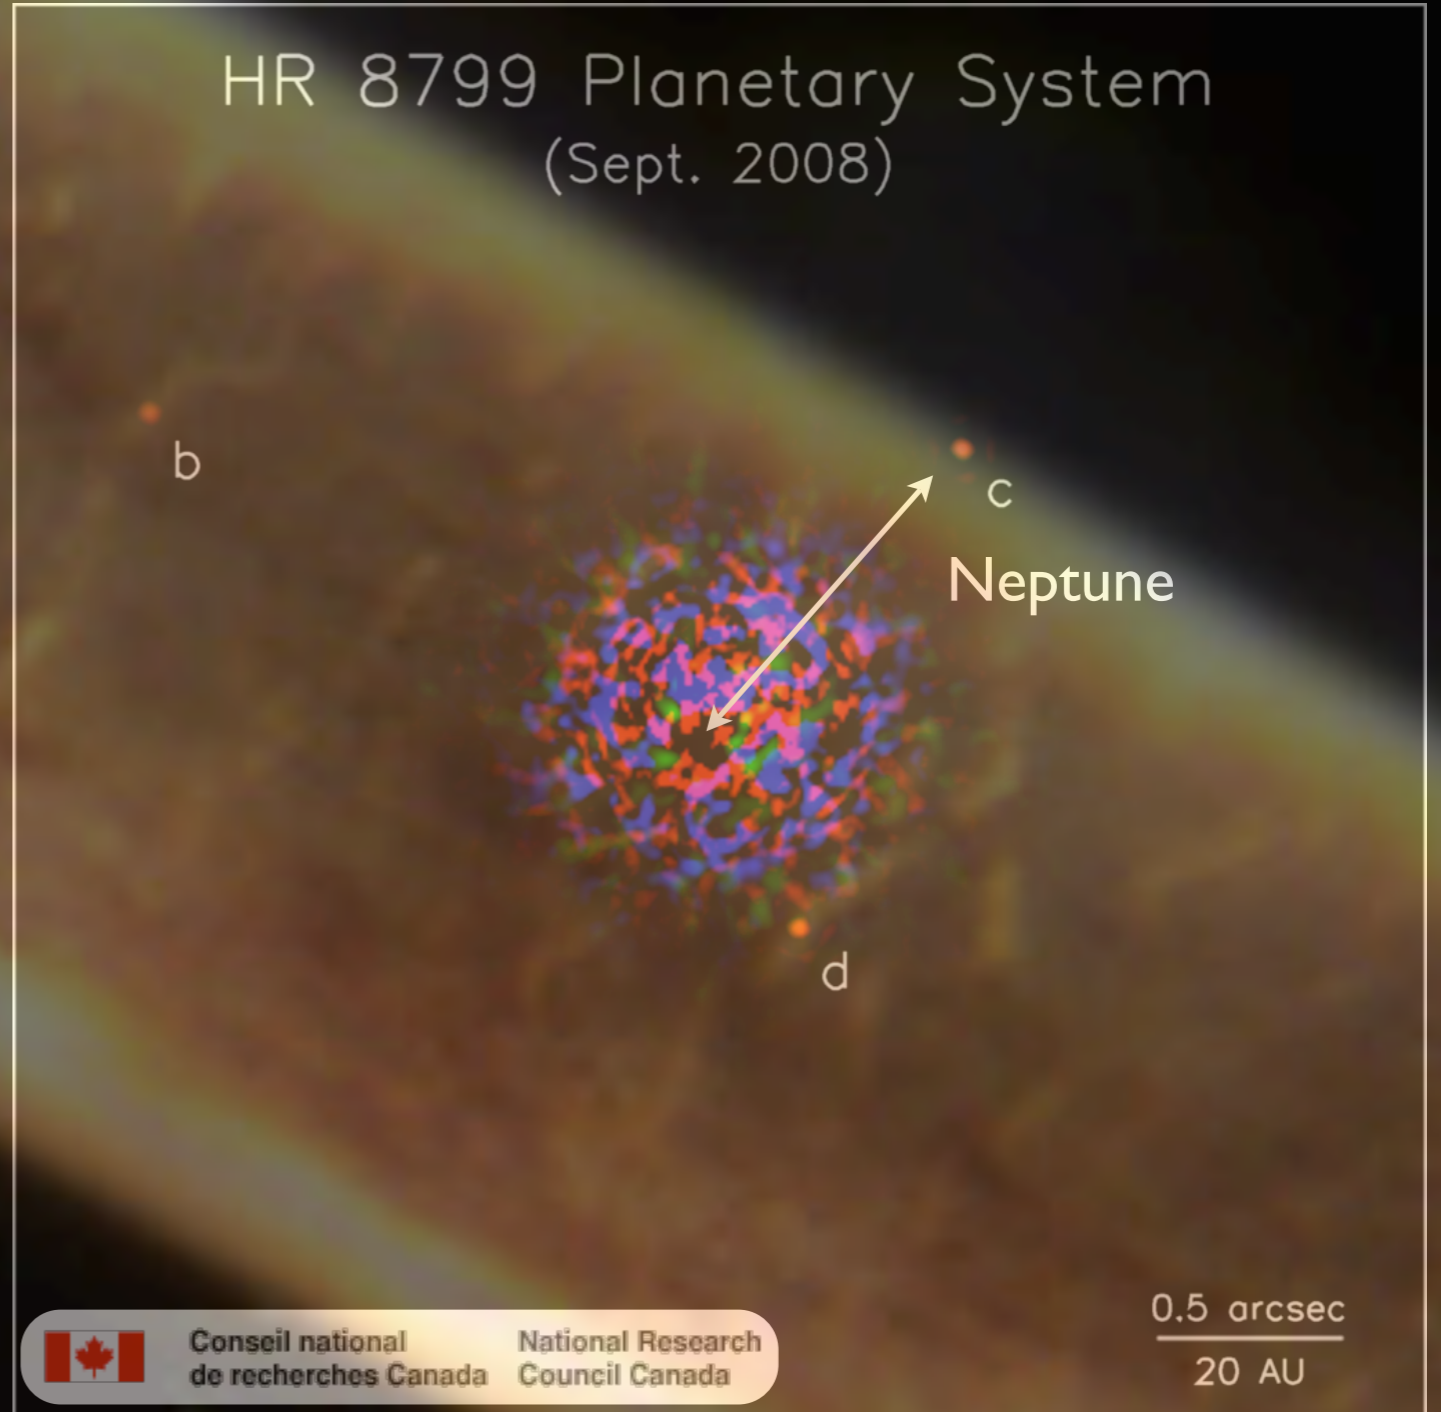

# Voyager 1 (43 AU)

## 18 cm diameter

# Keck 2 (130 ly), 10m diameter

## HR 8799 Planetary System (Sept. 2008)

HR 8799 age?

# HR 8799 Age Estimation

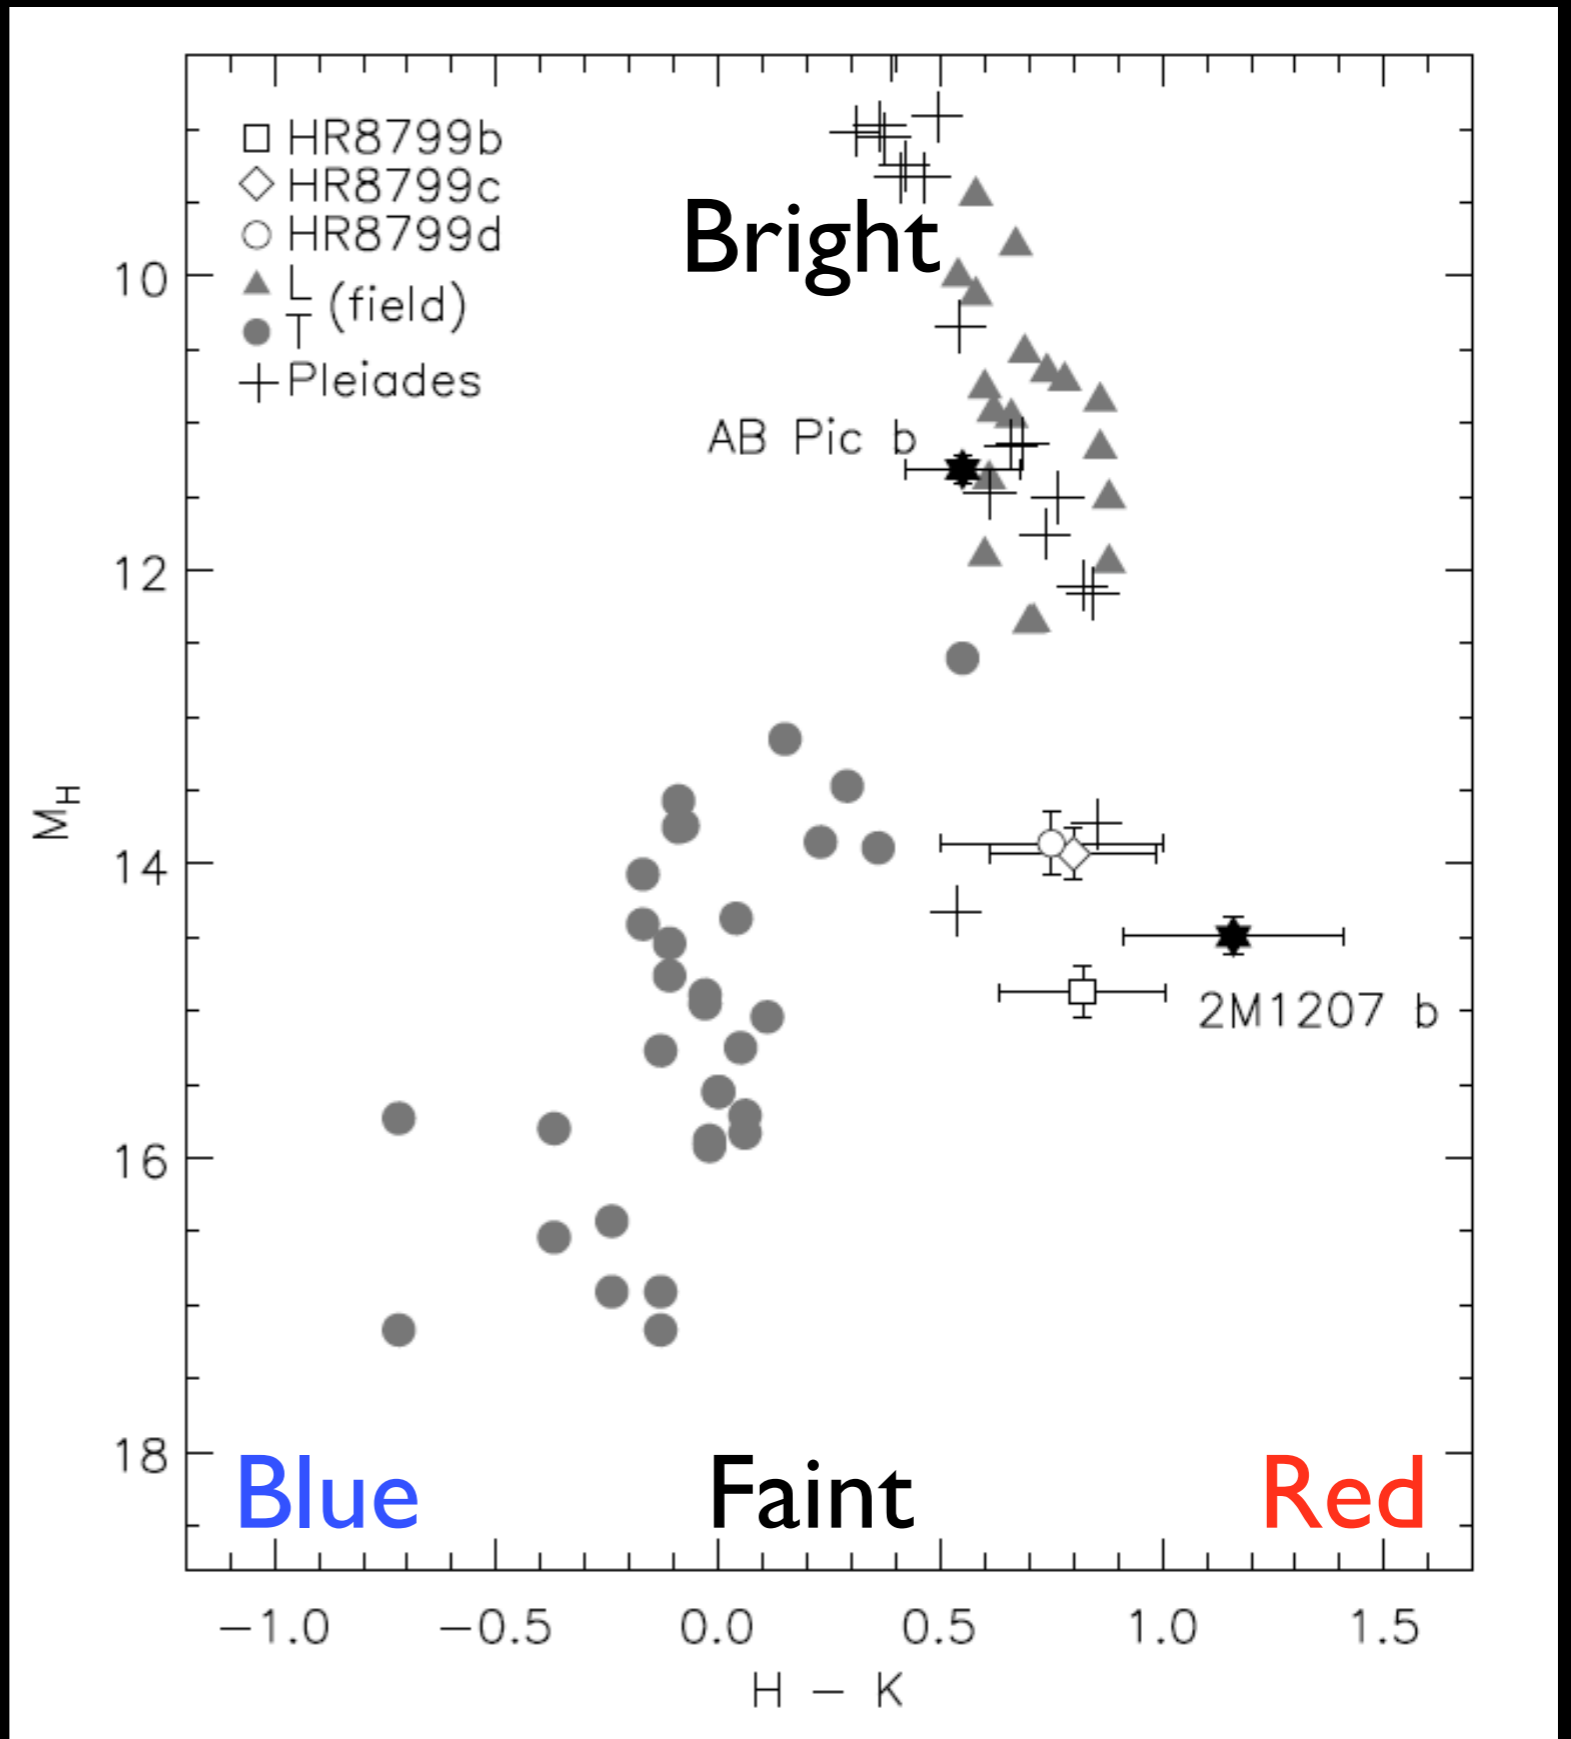

HR 8799 age = 30-160 Myr

# Mass, radius & Teff estimations from cooling tracks

The 3 planet's colors are more consistent with Pleiades low mass  $\sim 11 M_{\text{Jup}}$  objects and 2M1207b than field BDs.

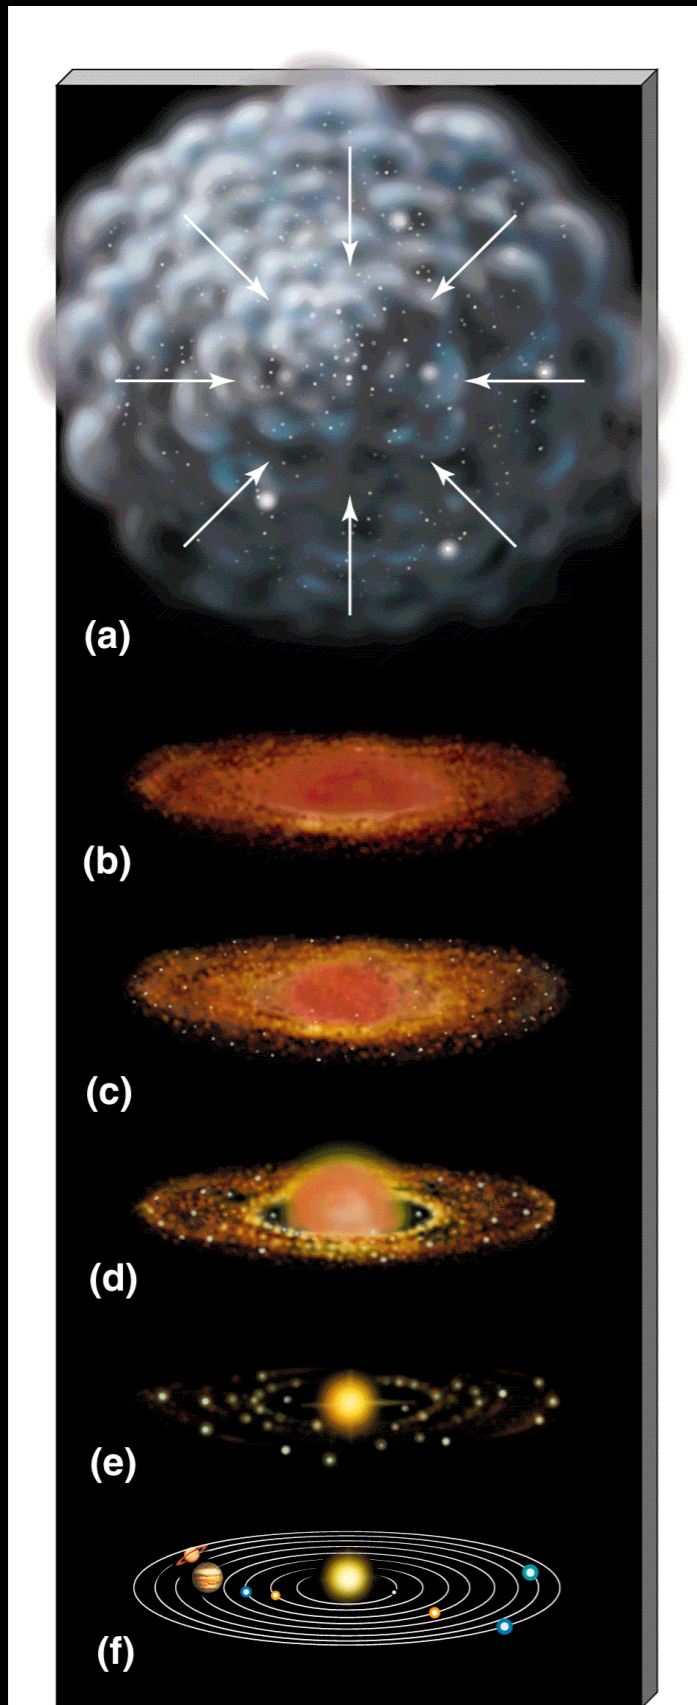

Physics untested - No corresponding objects in the field.

# Planetary System Formation

Solar system

# TWO PLANET FORMATION SCENARIOS

## Accretion model

Orbiting dust grains accrete into "planetesimals" through nongravitational forces.

Planetesimals grow, moving in near-coplanar orbits, to form "planetary embryos."

Gas-giant planets accrete gas envelopes before disk gas disappears.

Gas-giant planets scatter or accrete remaining planetesimals and embryos.

## Gas-collapse model

A protoplanetary disk of gas and dust forms around a young star.

Gravitational disk instabilities form a clump of gas that becomes a self-gravitating planet.

Dust grains coagulate and sediment to the center of the protoplanet, forming a core.

The planet sweeps out a wide gap as it continues to feed on gas in the disk.

# Solar system formation leftover vs HR 8799

Spitzer IR excess, dust at  $\sim 10$  AU (asteroid belt?) Chen et al. 2006

IRAS/ISO IR excess, dust at  $\sim 100$  AU (Kuiper belt?) Rhee et al. 2007

Spitzer resolve dust emission, dust at  $\sim 1000$  AU (Oort cloud?) Lu et al.

HR 8799 Planetary System

# HR 8799 planetary system probably formed in a disk

# HR 8799bcd Characteristics

HR 8799	Separation (AU)	Period (years)	Temperature (K)	Radius (R <sub>Jup</sub> )	Mass (M <sub>Jup</sub> )
b	68	~460	820	1.30	7
c	38	~190	1000	1.25	10
d	25	~100	1000	1.20	10

Circular  
face-on

60 Myr

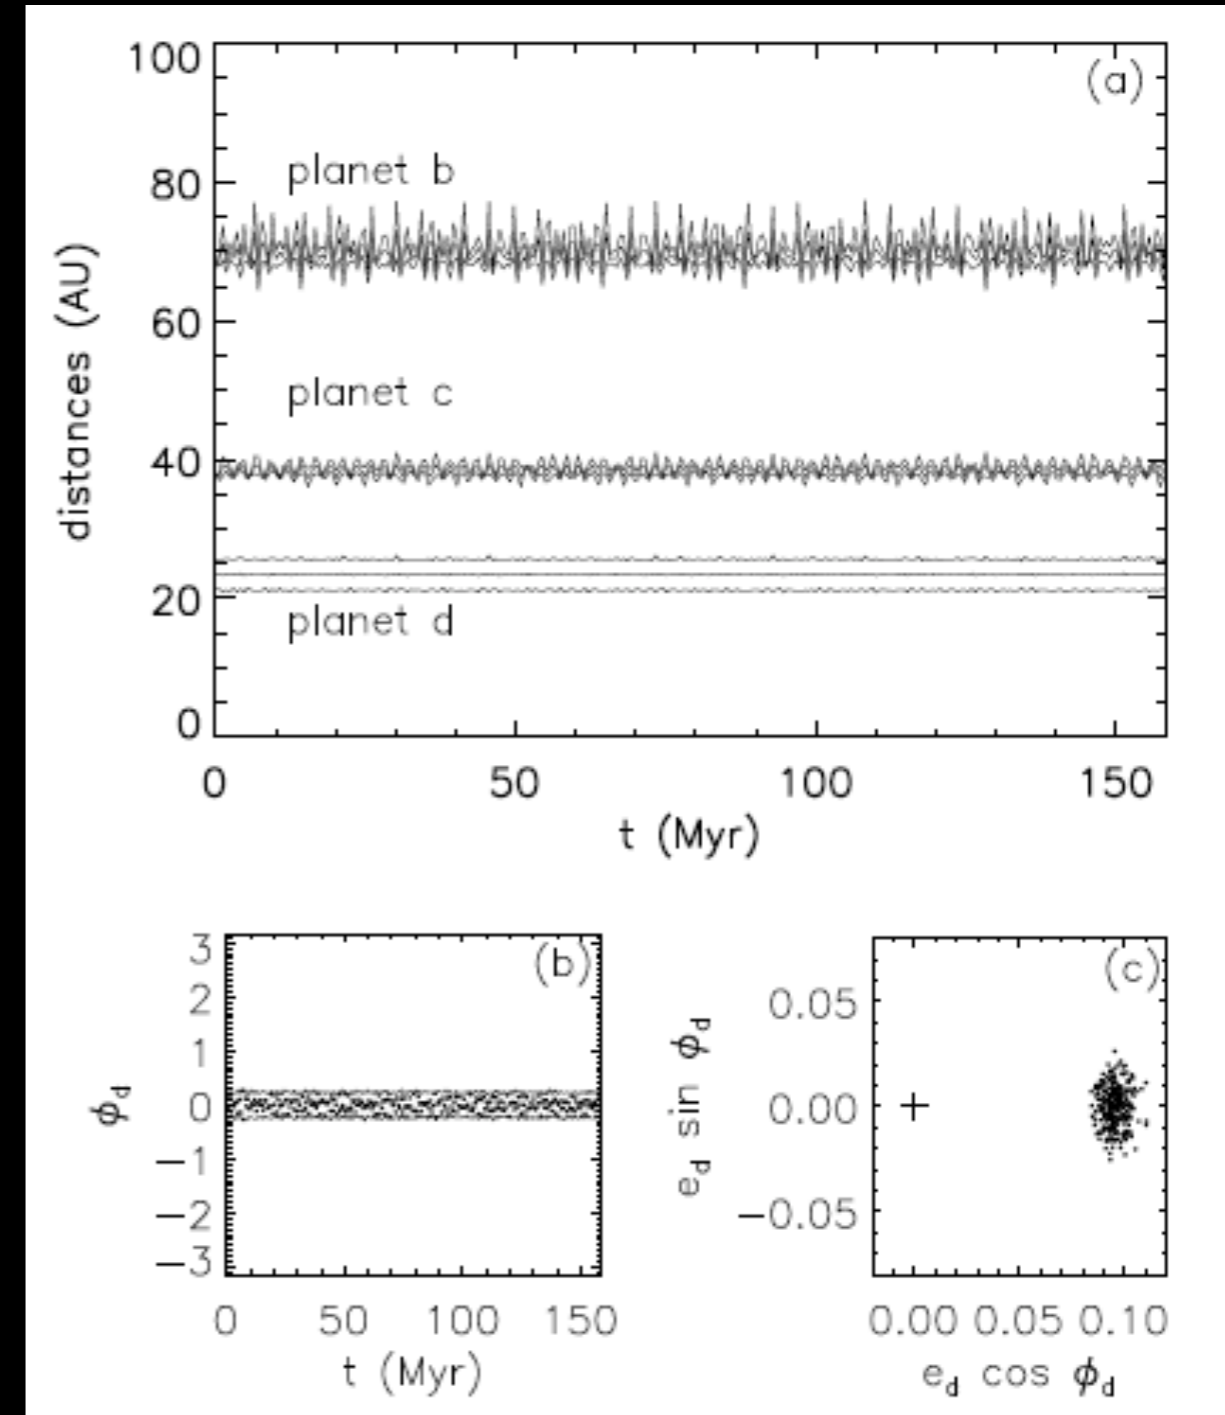

# HR 8799bcd vs Radial Velocities

- Previous ADI GKM survey = NO DETECTION
- ~335 exoplanets known, 309 by RV - limited to ~5 AU.
- RV: 31 multi-planet systems, only 10  $\geq$  3 planets (only ~3%)
- Planets are probably more likely around more massive stars.
- Multi-planet systems are also probably more likely at wide separations.

# Dynamic Analysis

- Not perfectly face-on & not perfectly circular
- Non-resonance cases = masses need to be lower ( $< 2M_{\text{Jup}}$ )
- 2:1 resonance for c & d: some cases stable for age
- 4:2:1 resonance: stable up to  $\sim 20 M_{\text{Jup}}$  & 60 Myr.

## 4:2:1 resonance

Younger age / model over predict mass / 4:2:1 resonance

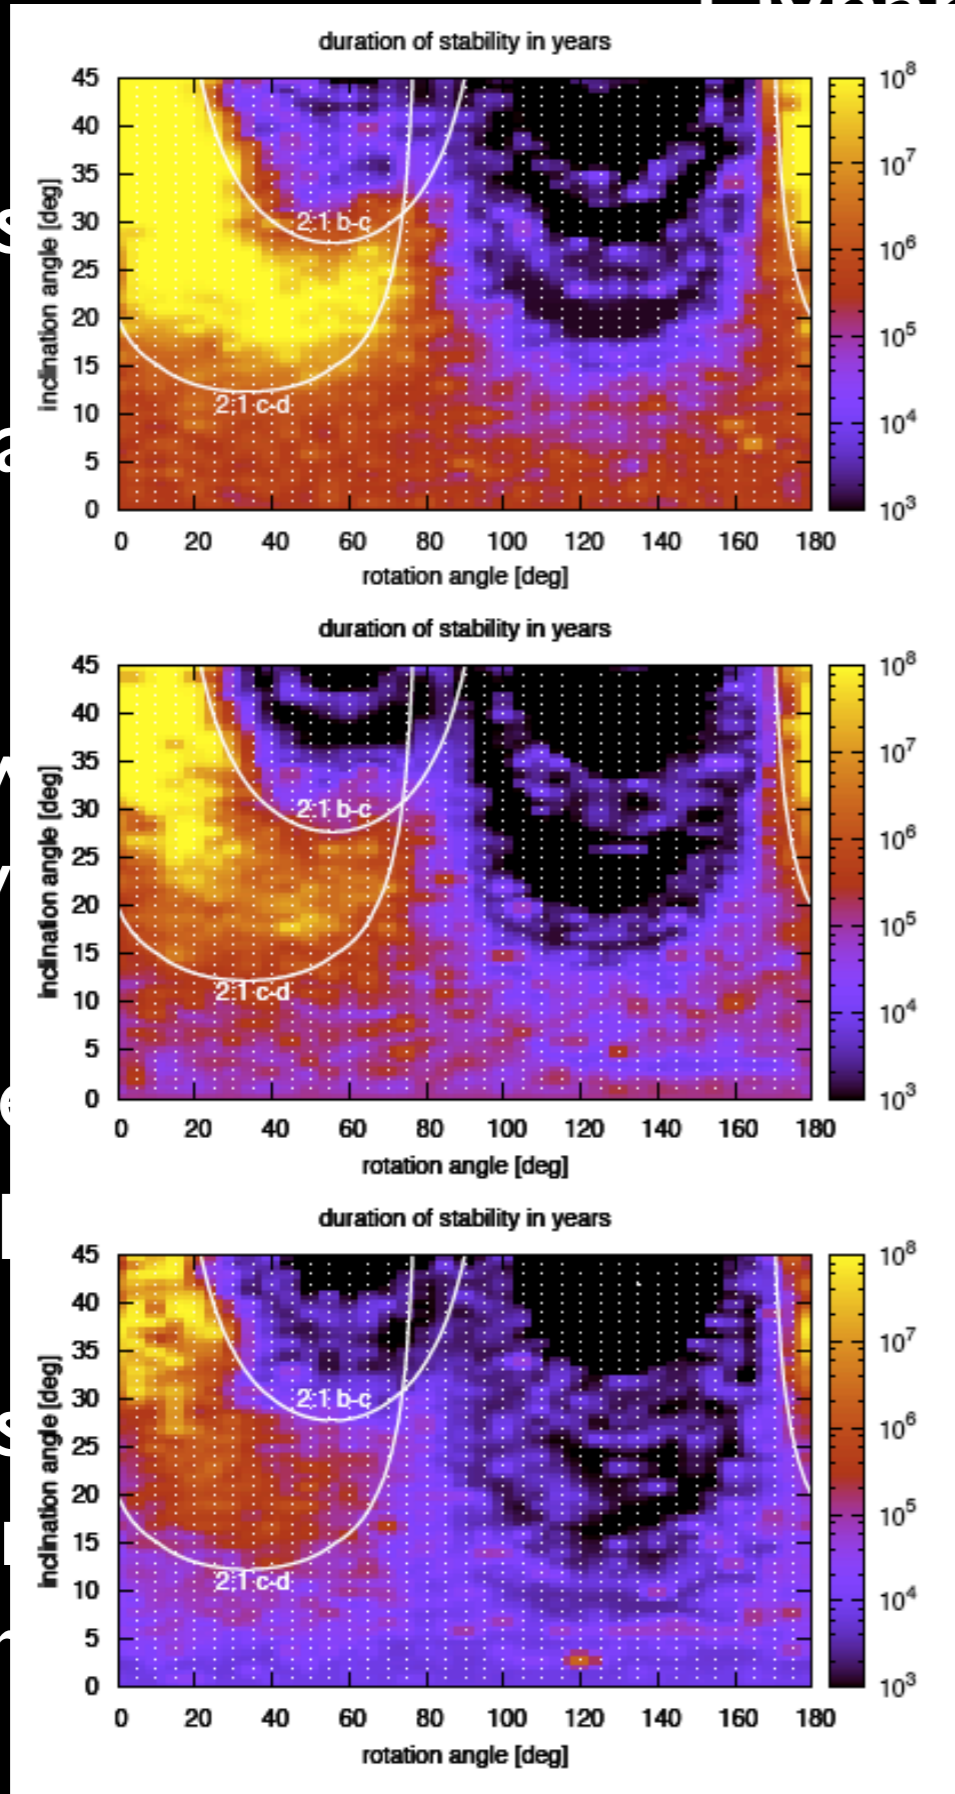

- Heavy mutual interactions
- Most likely 1:2:4 resonance
- Lower masses?
- 1:2:4 system may be unstable in a few 100 Myr.

20 AU

# Conclusions

- HR 8799, first directly image of a multi-planet system. First at separation similar to the outer planets of our solar system.
- Peculiar star: Lambda boo, Gamma Dor & Vega-like.
- Cooling tracks:  $\sim 7-10$  M<sub>Jup</sub> from 25-70 AU, twice the SS size.  $\sim 800-1000$ K and 1.2 R<sub>Jup</sub>. Supported by color - look like 2M1207b
- Evidences  $\sim$ face-on orbits/ $\sim$ circular orbits/ $\sim$ coplanar/ star view  $\sim$  by the pole - formed in a disk.
- Dynamic simulations = lower masses & 4:2:1 resonance.
